

## **The 9<sup>th</sup> Child Suffering From Bird Flu At Kantha Bopha This Year**

The ninth case, same as the 7<sup>th</sup> case, of Bird Flu could be saved in the Kantha Bopha Hospital. The clinical Diagnosis was done by the Doctors of Kantha Bopha at the arrival of the severely sick child. The samples were sent immediately to “Pasteur”, where they confirmed the diagnosis.

In Cambodia Daily of July 13<sup>th</sup> Mr Krishman from WHO is cited: “The boy is in a stable condition at Kantha Bopha hospital, after he was administrated Tamiflu.”

This statement is ridiculous. Tamiflu, at least in a child suffering from bird flu, is not significantly effective for different reasons. This is only believed and propagated by WHO and the pharmaceutical factory ROCHE making big business with Tamiflu.

We try to save and support first of all the vital functions of circulation and respiration. Secondly we try to stop or reduce the ongoing inflammatory process in the lungs. And we treat accompanying infectious often leading to death, for example Tuberculosis. The Virus of Bird Flu can wake up the dormant Tuberculosis in the child. A dormant Tuberculosis was discovered in this 9<sup>th</sup> case by the CT Scanner. The TB is still a main problem for Cambodian children still underestimated by WHO.

In all nine cases the Bird Flu was discovered by Kantha Bopha. We inform the Ministry of Health immediately. They inform the WHO. And then WHO finds around the children’s house chicken und ducks having died. WHO should be aware of chicken and ducks passing away by Bird Flu before a child must suffer immensely and often pass away by this horrible disease. And they should take adequate action. “There was a large number of ducks and chicken dying in the area”, Mr Krishman from WHO is cited in the Cambodia Daily on 13<sup>th</sup> July 2013, a week after the child has arrived in Kantha Bopha Hospital.

Dr. Beat Richner, Head and Founder of the Kantha Bopha Hospitals
